

I am W4NI and have had an FCC license for 35 years. The proposal to increase powerline data transmission has possible severe interference impacts on radio amateur emergency service. This FCC proposal lacks your usual technical competence. This power line technology has been rejected by other nations as useless. It needs much more study and research BEFORE it is even considered for further deployment. There are many other technologies available to carry data that have no potential interference effects. FCC should end this proposal immediately and then embark on a careful study of possible HF interference to radio amateurs and others.
